Utilities Mapping

► Process

JSA GIServices specializes in developing public utilities data from the ground up. We take the time to ensure that our utilities data is digitized and collected with the highest accuracy possible. JSA works directly with clients to come up with a data development plan that is customized to fit their budget. JSA can map utilities by digitizing features from existing CAD drawings or can increase the accuracy by collecting sub-foot GPS data and integrating it into the digitized data.

► Accountability

Are you tired of your data development project taking too long without knowing what stage the contractor is on? We provide our clients with a secure web interface for browsing and querying the data throughout the development process! This ensures contractor accountability and gives the client a constant connection and opportunity for feedback during the development process.

► Deliverables

We provide our clients with utilities data in a digital format of your choice, including utilities data in topologically correct geodatabase format or Shapefile. JSA provides water, sewer, and storm utilities data in the standardized ESRI utilities geodatabase format with network features built for additional analysis capabilities. JSA also provides clients with a geodata or web mapping service URL for connection to the dataset anywhere an internet connection is available.

► Benefits

- Utilities data provides a quick return on investment by providing greater visibility and usage when combined with other datasets
- JSA provides high accuracy and quick turn around
- Properly built utilities data provides increased decision making support and additional analysis capabilities
- Visualization and mapping utilities features give you an overall, connected view of your network in relation to your customers and surrounding infrastructure
